Foot problems such as hammertoes, bunions, neuromas, and plantar fasciitis plague people of all ages. Many think that shoes are the culprit while, in reality, the shoes simply exacerbate a problem inherent in the foot anatomy and function, called biomechanics. Through examination, we can help educate you on the causes of your particular problem.

Surgery is the first solution most people think of regarding these ailments. It may be comforting to know that, for many of these conditions, there are nonsurgical solutions that are not only medically proper to consider before surgery, but most insurances require it. With proper determination of the causes, we can present a choice of solutions.

When surgery is the final course of action, it need not be faced with dread. Outpatient surgery has become the focus of virtually all common podiatric surgeries, with patient safety and speedy recovery the priority of all involved. We can help you through this period with knowledgeable preoperative and caring postoperative treatment, as well as performing the surgery itself.

Whether your podiatric needs are medical, orthopedic, or surgical, We can evaluate your condition and help determine the choice of remedies best for you.
